SUMMARY

AI Engineer with a full-stack background and 3+ years of experience shipping production software.

I build what LLM products run on: agent runtimes, MCP servers, tool layers, and pipelines, plus the APIs, auth, job systems, and security that keep them running in production.

I work agent-first every day using multiple tools, with Claude Code as my main development environment, and I care about software that stays simple, testable, reliable, and maintainable.

WORK EXPERIENCE

AI Software Engineer (06/2025 – Present)

MarketFully

- Built the platform's remote **MCP server** as its sole engineer, from architecture to production, in TypeScript and Node with **12 production tools** (including brand data, transcreation, document translation, brief generation, and content creation) that let customers operate MarketFully from Claude, Codex, and other MCP clients.
- Developed the **agent runtime** of the new API with LangGraph and the Anthropic and OpenAI SDKs: agents call the platform's capabilities as tools, keep conversation memory, and log their model usage to an AI-usage audit service.
- Improved **output quality** in the content generation and transcreation pipelines: moved outlines to an XML structure the models follow reliably, enforced target length, and made each brand's glossaries and tone of voice apply by default.
- Architected and built the **REST API** that backs the **MCP server** end-to-end (auto-generated OpenAPI specs, workspace API keys with usage metering, signed webhooks), then made it the platform's single backend: moved the web app behind a light BFF with dual authentication (user sessions and API keys), replacing the legacy core service.
- Implemented a durable **job queue on Redis** for long-running LLM work such as batch transcreations, streaming per-job progress to the UI over SSE.
- Packaged the team's security standards as **agent skills**, rules, and GitHub instructions, with **agent hooks** that block non-compliant changes before they land, backed by 3,000+ lines of technical documentation (security standards, RBAC, feature architecture) adopted across the team.
- Architected a granular **RBAC permission system** from scratch: route-level enforcement, frontend access-control components, role inheritance, and an admin dashboard for role management.
- Shipped **S3-based file infrastructure** across 5 buckets: multipart uploads with pre-signed URLs, real-time progress tracking, and pause, resume, and cancel operations.
- Core stack: TypeScript, Python, React, Node.js, Hono, LangGraph, Celery, Prisma, PostgreSQL, Redis, Pinecone, and AWS.

Software Developer (02/2025 – 06/2025)

OneTree

- Worked **directly with the client's stakeholders** to scope requirements and deliver features in short iterations.
- Integrated systems and ran **complex data migrations** over REST APIs and MySQL with zero downtime.
- Diagnosed and fixed production bugs across services, tracing failures from the frontend down to the database.
- Core stack: JavaScript, Node.js, Java, and MySQL.

Software Engineer (04/2024 – 02/2025)

Vodafone

Full Stack Jr. Developer (05/2023 – 04/2024)

- Got **promoted** to take on new responsibilities while maintaining prior duties.
- Turned the platform **architects' requirements** into implementation designs: documented each decision as an **ADR** with flowcharts and diagrams in Confluence, and broke the work down into Jira tickets for the rest of the team.
- Managed **monthly production releases** across five teams, coordinating cross-team dependencies and keeping backward compatibility and stable deployments.
- Led a project-wide **refactor that cut resource consumption by 30%** and sped up the development of new features.
- Centralized the team's email service with the Builder pattern, taking 30,000+ lines of duplicated code down to ~7,000 reusable ones and making styling consistent across every email.
- Set up Jest, ESLint, Prettier, and SonarQube from scratch in a 200,000+ line codebase, enforcing at least **80%** test coverage on new contributions.
- Core stack: TypeScript, React, Next.js, Node.js, Sequelize, PostgreSQL, Redis, Kafka, Prometheus, and AWS.

PERSONAL PROJECTS

- **Cuadriva** (*in development*): Multi-tenant ERP for SME distributors in Argentina. Commercial product, covering inventory, orders, sales, purchases, running accounts, and a public ordering catalog, with an LLM pipeline that turns payment receipts into recorded payments in the system.
- **Local Rules** (github.com/JoacocoG/local-rules): Trained eight self-healing neural cellular automata in PyTorch (8,336 parameters, 33 KB, 94–99.9% regeneration IoU) that grow an image from a single cell and run live on WebGPU compute shaders, closing an interactive essay with six real-time GPU simulations verified by 12 headless parity tests.
- **Portfolio and Personal Blog** (joaquingodoy.com): A 1920s broadsheet newspaper built in Astro with a hand-written motion engine. Hosts my thoughts on AI, software engineering, and whatever else I find worth thinking about.

SKILLS

Languages: TypeScript, JavaScript, Python, Java, Rust, SQL

AI and Agents: Claude Code, Codex, Cursor, Agent skills, Agent hooks, Subagents, MCP connectors, MCP servers, LLM applications, AI agents, Tool calling, LangChain, LangGraph, LangSmith, Anthropic SDK, OpenAI SDK, PyTorch, Prompt engineering, Structured outputs, RAG, Embeddings, Pinecone, Evals

Frontend: React, Angular, Next.js, TanStack, Remix, Astro, Zustand, WebGPU, Three.js, Tailwind CSS, shadcn/ui, Storybook

Backend: Node.js, Hono, Express, NestJS, FastAPI, Spring Boot, BullMQ, Kafka, Celery, REST, Zod, OpenAPI, oRPC, Webhooks

Databases: PostgreSQL, MySQL, Cassandra, MongoDB, Redis, Supabase, Prisma, Drizzle, Sequelize

Cloud and DevOps: AWS, Railway, Docker, GitHub Actions, Nginx, Cloudflare, Prometheus, Grafana, Kibana, PostHog, Sentry

Testing and Code Quality: Vitest, Jest, Cypress, Playwright, SonarQube, Biome, ESLint

EDUCATION

Engineering Degree in Computer Science, UADE (2018 – 2022)

LANGUAGES

Spanish (native), English (C1: professional working proficiency)
